Scan Report

January 26, 2026

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was " hgdfdghgdgd". The scan started at Mon Jan 26 01:47:47 2026 UTC and ended at Mon Jan 26 14:04:13 2026 UTC. The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

2.1.1 Critical 8019/tcp

Critical (CVSS: 9.8)
NVT: Apache Tomcat AJP RCE Vulnerability (Ghostcat) - Active Check

Summary
Apache Tomcat is prone to a remote code execution (RCE) vulnerability in the AJP connector dubbed 'Ghostcat'.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
```
The returned status is '500', which should be '403' on a patched system, when tr
↪ying to read a file which indicates that the installation is vulnerable.
```

Solution:
Solution type: VendorFix
- Update Apache Tomcat to version 7.0.100, 8.5.51, 9.0.31 or later
- For other products using Tomcat please contact the vendor for more information on fixed versions

Affected Software/OS
Apache Tomcat versions prior 7.0.100, 8.5.51 or 9.0.31 when the AJP connector is enabled. Other products like JBoss or Wildfly which are using Tomcat might be affected as well.

Vulnerability Insight
Apache Tomcat server has a file containing vulnerability, which can be used by an attacker to read or include any files in all webapp directories on Tomcat, such as webapp configuration files or source code.

Vulnerability Detection Method
Sends a crafted AJP request and checks the response.

Impact
An EOL version of Apache Tomcat is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: VendorFix
Update the Apache Tomcat version on the remote host to a still supported version.

Vulnerability Detection Method
Checks if an EOL version is present on the target host.

Impact

Successful exploitation will allow remote attackers to bypass certain security restrictions and perform unauthorized actions. This may aid in further attacks.

Solution:

Solution type: VendorFix

Upgrade to Apache Tomcat version 9.0.9, 8.0.53, 7.0.89 or 8.5.32 or later. Please see the references for more information.

Affected Software/OS

Apache Tomcat versions 9.0.0.M1 to 9.0.8 Apache Tomcat versions 8.5.0 to 8.5.31 Apache Tomcat versions 8.0.0.RC1 to 8.0.52 Apache Tomcat versions 7.0.41 to 7.0.88

Vulnerability Insight

The flaw exists because defaults settings for the CORS filter provided in Apache Tomcat are insecure and enable 'supportsCredentials' for all origins.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Vulnerability Insight
The original implementation of partial PUT used a temporary file based on the user provided file name and path with the path separator replaced by '.'.
If all of the following are true, a malicious user is able to view security sensitive files and/or inject content into those files:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- a target URL for security sensitive uploads that is a sub-directory of a target URL for public uploads
- attacker knowledge of the names of security sensitive files being uploaded
- the security sensitive files also being uploaded via partial PUT
If all of the following are true, a malicious user is able to perform remote code execution:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- application is using Tomcat's file based session persistence with the default storage location
- application includes a library that may be leveraged in a deserialization attack

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to a rewrite rule bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.104
Installation
path / port:       8040/tcp
```

Solution:

Solution type: VendorFix

Update to version 9.0.104, 10.1.40, 11.0.6 or later.

Affected Software/OS

Apache Tomcat version 9.0.102 and prior, 10.x through 10.1.39 and 11.0.0-M1 through 11.0.5. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight

For a subset of unlikely rewrite rule configurations, it is possible for a specially crafted request to bypass some rewrite rules. If those rewrite rules effectively enforced security constraints, those constraints could be bypassed.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

The Apache Tomcat version on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
The "Apache Tomcat" version on the remote host has reached the end of life.
CPE:               cpe:/a:apache:tomcat:8.5.23
Installed version: 8.5.23
Location/URL:      8081/tcp
EOL version:       8.5
EOL date:          2024-03-31
```

Impact

An EOL version of Apache Tomcat is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:

Solution type: VendorFix

Update the Apache Tomcat version on the remote host to a still supported version.

Vulnerability Detection Method

Checks if an EOL version is present on the target host.

Summary
Apache Tomcat is prone to a security bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.32
Installation
path / port:       8081/tcp
```

Impact
Successful exploitation will allow remote attackers to bypass certain security restrictions and perform unauthorized actions. This may aid in further attacks.

Solution:
Solution type: VendorFix
Upgrade to Apache Tomcat version 9.0.9, 8.0.53, 7.0.89 or 8.5.32 or later. Please see the references for more information.

Affected Software/OS
Apache Tomcat versions 9.0.0.M1 to 9.0.8 Apache Tomcat versions 8.5.0 to 8.5.31 Apache Tomcat versions 8.0.0.RC1 to 8.0.52 Apache Tomcat versions 7.0.41 to 7.0.88

Vulnerability Insight
The flaw exists because defaults settings for the CORS filter provided in Apache Tomcat are insecure and enable 'supportsCredentials' for all origins.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution type: VendorFix

Update to version 9.0.104, 10.1.40, 11.0.6 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache Tomcat version 9.0.102 and prior, 10.x through 10.1.39 and 11.0.0-M1 through 11.0.5. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
For a subset of unlikely rewrite rule configurations, it is possible for a specially crafted request to bypass some rewrite rules. If those rewrite rules effectively enforced security constraints, those constraints could be bypassed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Insight
The original implementation of partial PUT used a temporary file based on the user provided file name and path with the path separator replaced by '.'.
If all of the following are true, a malicious user is able to view security sensitive files and/or inject content into those files:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- a target URL for security sensitive uploads that is a sub-directory of a target URL for public uploads
- attacker knowledge of the names of security sensitive files being uploaded
- the security sensitive files also being uploaded via partial PUT
If all of the following are true, a malicious user is able to perform remote code execution:
- writes enabled for the default servlet (disabled by default)
- support for partial PUT (enabled by default)
- application is using Tomcat's file based session persistence with the default storage location
- application includes a library that may be leveraged in a deserialization attack

Solution:
Solution type: VendorFix
Update to version 8.5.76, 9.0.21 or later.

Affected Software/OS
Apache Tomcat 8.5.0 through 8.5.75 and 9.0.0.M1 through 9.0.20.

Vulnerability Insight
If a web application sends a WebSocket message concurrently with the WebSocket connection closing, it is possible that the application will continue to use the socket after it has been closed. The error handling triggered in this case could cause the a pooled object to be placed in the pool twice. This could result in subsequent connections using the same object concurrently which could result in data being returned to the wrong use and/or other errors.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Insight
When processing an HTTP/2 stream, Tomcat did not handle some cases of excessive HTTP headers correctly. This led to a miscounting of active HTTP/2 streams which in turn led to the use of an incorrect infinite timeout which allowed connections to remain open which should have been closed.

Summary
Apache Tomcat is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.107
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.107 or later.

Affected Software/OS
Apache Tomcat version 9.0.106 and prior.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
A race condition on connection close could trigger a JVM crash when using the APR/Native connector leading to a DoS. This was particularly noticeable with client initiated closes of HTTP/2 connections.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Insight

A mismatch caused by client-triggered server-sent stream resets between HTTP/2 specifications and the internal architectures of some HTTP/2 implementations may result in excessive server resource consumption leading to denial-of-service (DoS). By opening streams and then rapidly triggering the server to reset them, using malformed frames or flow control errors, an attacker can exploit incorrect stream accounting. Streams reset by the server are considered closed at the protocol level, even though backend processing continues. This allows a client to cause the server to handle an unbounded number of concurrent streams on a single connection.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

`Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10`

Summary
Apache Tomcat is prone to an information disclosure vulnerability in HTTP/2.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.60
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.60, 9.0.40, 10.0.0-M10 or later.

Affected Software/OS
Apache Tomcat 8.5.0 to 8.5.59, 9.0.0.M1 to 9.0.39 and 10.0.0-M1 to 10.0.0-M9.

Vulnerability Insight
It was discovered that Apache Tomcat could re-use an HTTP request header value from the previous stream received on an HTTP/2 connection for the request associated with the subsequent stream. While this would most likely lead to an error and the closure of the HTTP/2 connection, it is possible that information could leak between requests.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS
Apache Tomcat 8.5.x - 8.5.61, 9.0.0.M1 - 9.0.41 and 10.0.x prior to 10.0.1.

Vulnerability Insight
When responding to new h2c connection requests, Apache Tomcat could duplicate request headers and a limited amount of request body from one request to another meaning user A and user B could both see the results of user A's request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10

Summary
Apache Tomcat is prone to a session fixation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.50
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.99, 8.5.50, 9.0.30 or later.

Affected Software/OS
Apache Tomcat 7.0.0 to 7.0.98, 8.5.0 to 8.5.49 and 9.0.0.M1 to 9.0.29.

Vulnerability Insight
When using FORM authentication there was a narrow window where an attacker could perform a session fixation attack. The window was considered too narrow for an exploit to be practical but, erring on the side of caution, this issue has been treated as a security vulnerability.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS
Apache Tomcat versions 8.5.0 to 8.5.40 and 9.0.0.M1 to 9.0.19.

Vulnerability Insight
The fix for CVE-2019-0199 was incomplete and did not address HTTP/2 connection window exhaustion on write. By not sending WINDOW_UPDATE messages for the connection window (stream 0) clients are able to cause server-side threads to block eventually leading to thread exhaustion and a DoS.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS
Apache Tomcat 8.5.0 to 8.5.40 and 9.0.0.M1 to 9.0.19.

Vulnerability Insight
The HTTP/2 implementation accepts streams with excessive numbers of SETTINGS frames and also permitts clients to keep streams open without reading/writing request/response data. By keeping streams open for requests that utilises the Servlet API's blocking I/O, clients are able to cause server-side threads to block eventually leading to thread exhaustion and a DoS.

Solution:
Solution type: VendorFix
Update to version 8.5.56, 9.0.36, 10.0.0-M6 or later.

Affected Software/OS
Apache Tomcat 8.5.0 to 8.5.55, 9.0.0.M1 to 9.0.35 and 10.0.0-M1 to 10.0.0-M5.

Vulnerability Insight
A specially crafted sequence of HTTP/2 requests sent to Apache Tomcat could trigger high CPU usage for several seconds. If a sufficient number of such requests were made on concurrent HTTP/2 connections, the server could become unresponsive.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to a request smuggling vulnerability.

```

. . . continues on next page . . .

. . . continued from previous page . . .

```
Installation
path / port:        8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.83, 9.0.68, 10.0.27, 10.1.1 or later.

Affected Software/OS
Apache Tomcat version 8.5.0 through 8.5.82, 9.0.0-M1 through 9.0.67, 10.0.0-M1 through 10.0.26 and 10.1.0.

Vulnerability Insight
If Tomcat is configured to ignore invalid HTTP headers via setting rejectIllegalHeader to false (the default for 8.5.x only), Tomcat does not reject a request containing an invalid Content-Length header making a request smuggling attack possible if Tomcat is located behind a reverse proxy that also fails to reject the request with the invalid header.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Impact

Successful exploitation will allow an attacker to bypass certain security restrictions and perform unauthorized actions.

Solution:

Solution type: VendorFix

Upgrade to Apache Tomcat version 9.0.10 or 8.5.32 or 8.0.53 or 7.0.90 or later. Please see the references for more information.

Affected Software/OS

Apache Tomcat versions 9.0.0.M1 to 9.0.9, 8.5.0 to 8.5.31, 8.0.0.RC1 to 8.0.52 and 7.0.35 to 7.0.88 on Linux.

Vulnerability Insight

The flaw exists due to a missing host name verification when using TLS with the WebSocket client.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Summary
Apache Tomcat is prone to a request smuggling vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.96
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.96, 9.0.83, 10.1.16, 11.0.0-M11 or later.

Affected Software/OS
Apache Tomcat versions 8.5.0 through 8.5.95, 9.0.0-M1 through 9.0.82, 10.1.0-M1 through 10.1.15 and 11.0.0-M1 through 11.0.0-M10.

Vulnerability Insight
Tomcat does not correctly parse HTTP trailer headers. A specially crafted trailer header that exceeds the header size limit could cause Tomcat to treat a single request as multiple requests leading to the possibility of request smuggling when behind a reverse proxy.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to a denial of service (DoS) vulnerability when running with enabled Tomcat clustering over an untrusted network.

Quality of Detection (QoD): 1%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     See solution information
Installation
path / port:       8040/tcp
```

Solution:

Solution type: Mitigation

- Don't run Apache Tomcat with enabled Tomcat clustering over an untrusted network
- Update Apache Tomcat to version 10.1.0-M15, 10.0.21, 9.0.63, 8.5.79 or later to receive the corrected / updated documentation

Affected Software/OS

- The documentation in Apache Tomcat 8.5.38 through 8.5.78, 9.0.13 through 9.0.62, 10.0.0-M1 through 10.0.20 and 10.1.0-M1 to 10.1.0-M14
- Apache Tomcat when running with enabled Tomcat clustering over an untrusted network

Vulnerability Insight

The documentation for the EncryptInterceptor incorrectly stated it enabled Tomcat clustering to run over an untrusted network. This was not correct. While the EncryptInterceptor does provide confidentiality and integrity protection, it does not protect against all risks associated with running over any untrusted network, particularly DoS risks.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

```
Fixed version:     8.5.85
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.85, 9.0.71, 10.1.5, 11.0.0-M3 or later.

Affected Software/OS
Apache Tomcat versions through 8.5.84, 9.0.0-M1 through 9.0.70, 10.x through 10.1.4 and 11.0.0-M1 only.

Vulnerability Insight
Apache Tomcat uses a packaged renamed copy of Apache Commons FileUpload to provide the file upload functionality defined in the Jakarta Servlet specification. Apache Tomcat was, therefore, also vulnerable to the Apache Commons FileUpload vulnerability CVE-2023-24998 as there was no limit to the number of request parts processed. This resulted in the possibility of an attacker triggering a DoS with a malicious upload or series of uploads.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to a privilege escalation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.49
Installation
path / port:       8040/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.0.99, 8.5.49, 9.0.29 or later. As a mitigation disable Tomcat's JmxRemoteLifecycleListener and use the built-in remote JMX facilities provided by the JVM.

Affected Software/OS

Apache Tomcat 7.0.0 to 7.0.97, 8.5.0 to 8.5.47 and 9.0.0.M1 to 9.0.28.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

When Tomcat is configured with the JMX Remote Lifecycle Listener, a local attacker without access to the Tomcat process or configuration files is able to manipulate the RMI registry to perform a man-in-the-middle attack to capture user names and passwords used to access the JMX interface. The attacker can then use these credentials to access the JMX interface and gain complete control over the Tomcat instance.

Summary
Apache Tomcat is prone to a remote code execution (RCE) vulnerability due to an incomplete fix.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.63
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.108, 8.5.63, 9.0.43, 10.0.2 or later.

Affected Software/OS
Apache Tomcat 7.0.x - 7.0.107, 8.5.x - 8.5.61, 9.0.0.M1 - 9.0.41 and 10.0.x prior to 10.0.1.

Vulnerability Insight
The fix for CVE-2020-9484 was incomplete. When using a highly unlikely configuration edge case, the Tomcat instance is still vulnerable to CVE-2020-9484. Note that both the previously published prerequisites for CVE-2020-9484 also apply to this issue.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Insight

If:
- an attacker is able to control the contents and name of a file on the server and
- the server is configured to use the PersistenceManager with a FileStore and

. . . continues on next page . . .

. . . continued from previous page . . .

- the PersistenceManager is configured with sessionAttributeValueClassNameFilter='null' (the default unless a SecurityManager is used) or a sufficiently lax filter to allow the attacker provided object to be deserialized and
- the attacker knows the relative file path from the storage location used by FileStore to the file the attacker has control over
then, using a specifically crafted request, the attacker will be able to trigger remote code execution via deserialization of the file under their control. Note that all of conditions must be true for the attack to succeed.

Affected Software/OS
Apache Tomcat 8.5.0 through 8.5.75 and 9.0.0.M1 through 9.0.20.

Vulnerability Insight
If a web application sends a WebSocket message concurrently with the WebSocket connection closing, it is possible that the application will continue to use the socket after it has been closed. The error handling triggered in this case could cause the a pooled object to be placed in the pool twice. This could result in subsequent connections using the same object concurrently which could result in data being returned to the wrong use and/or other errors.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS
Apache Tomcat version 9.0.107 and prior, 10.x through 10.1.43 and 11.0.0-M1 through 11.0.9. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
A mismatch caused by client-triggered server-sent stream resets between HTTP/2 specifications and the internal architectures of some HTTP/2 implementations may result in excessive server resource consumption leading to denial-of-service (DoS). By opening streams and then rapidly triggering the server to reset them, using malformed frames or flow control errors, an attacker can exploit incorrect stream accounting. Streams reset by the server are considered closed at the protocol level, even though backend processing continues. This allows a client to cause the server to handle an unbounded number of concurrent streams on a single connection.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS

Apache Tomcat versions prior to 9.0.90, 10.x through 10.1.24 and 11.0.0-M1 through 11.0.0-M20. Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by this flaw. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

When processing an HTTP/2 stream, Tomcat did not handle some cases of excessive HTTP headers correctly. This led to a miscounting of active HTTP/2 streams which in turn led to the use of an incorrect infinite timeout which allowed connections to remain open which should have been closed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary
Apache Tomcat is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.107
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.107 or later.

Affected Software/OS
Apache Tomcat version 9.0.106 and prior.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
A race condition on connection close could trigger a JVM crash when using the APR/Native connector leading to a DoS. This was particularly noticeable with client initiated closes of HTTP/2 connections.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Update to version 8.5.64, 9.0.44, 10.0.4 or later.

Affected Software/OS

Apache Tomcat 8.5.0 through 8.5.63, 9.0.0-M1 through 9.0.43 and 10.0.0-M1 through 10.0.2.

Vulnerability Insight

When Tomcat was configured to use NIO+OpenSSL or NIO2+OpenSSL for TLS, a specially crafted packet could be used to trigger an infinite loop resulting in a denial of service.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Apache Tomcat is prone to an information disclosure vulnerability in HTTP/2.

Quality of Detection (QoD): 30%

Fixed version: 8.5.60
Installation
path / port: 8081/tcp

Solution:

. . . continues on next page . . .

. . . continued from previous page . . .

Solution type: VendorFix
Update to version 8.5.60, 9.0.40, 10.0.0-M10 or later.

Affected Software/OS
Apache Tomcat 8.5.0 to 8.5.59, 9.0.0.M1 to 9.0.39 and 10.0.0-M1 to 10.0.0-M9.

Vulnerability Insight
It was discovered that Apache Tomcat could re-use an HTTP request header value from the previous stream received on an HTTP/2 connection for the request associated with the subsequent stream. While this would most likely lead to an error and the closure of the HTTP/2 connection, it is possible that information could leak between requests.

Installed version: 8.5.23
Fixed version:     8.5.94
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.94, 9.0.81, 10.1.14, 11.0.0-M12 or later.

Affected Software/OS
Apache Tomcat versions 8.5.0 through 8.5.93, 9.0.0-M1 through 9.0.80, 10.0.0 through 10.1.13 and 11.0.0-M1 through 11.0.0-M11.

Vulnerability Insight
The following flaws exist:
- CVE-2023-42795: When recycling various internal objects, including the request and the response, prior to re-use by the next request/response, an error could cause Tomcat to skip some parts of the recycling process leading to information leaking from the current request/response to the next.
- CVE-2023-44487: HTTP/2 rapid reset attack
- CVE-2023-45648: A specially crafted, invalid trailer header could cause Tomcat to treat a single request as multiple requests leading to the possibility of request smuggling when behind a reverse proxy.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 30%

```
Installed version: 8.5.23
Fixed version:     8.5.63
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.63, 9.0.43, 10.0.2 or later.

Affected Software/OS
Apache Tomcat 8.5.x - 8.5.61, 9.0.0.M1 - 9.0.41 and 10.0.x prior to 10.0.1.

Vulnerability Insight
When responding to new h2c connection requests, Apache Tomcat could duplicate request headers and a limited amount of request body from one request to another meaning user A and user B could both see the results of user A's request.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

cpe:/a:apache:tomcat:8.5.23
Detected by Apache Tomcat Detection Consolidation (OID: 1.3.6.1.4.1.25623.1.0.10
↪7652)
```

Summary

Apache Tomcat is prone to a denial of service vulnerability in the HTTP/2 implementation.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.41
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.41, 9.0.20 or later.

Affected Software/OS

Apache Tomcat 8.5.0 to 8.5.40 and 9.0.0.M1 to 9.0.19.

Vulnerability Insight

The HTTP/2 implementation accepts streams with excessive numbers of SETTINGS frames and also permitts clients to keep streams open without reading/writing request/response data. By keeping streams open for requests that utilises the Servlet API's blocking I/O, clients are able to cause server-side threads to block eventually leading to thread exhaustion and a DoS.

Affected Software/OS
Apache Tomcat versions 8.5.0 to 8.5.40 and 9.0.0.M1 to 9.0.19.

Vulnerability Insight
The fix for CVE-2019-0199 was incomplete and did not address HTTP/2 connection window exhaustion on write. By not sending WINDOW_UPDATE messages for the connection window (stream 0) clients are able to cause server-side threads to block eventually leading to thread exhaustion and a DoS.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:

Solution type: VendorFix

Update to version 8.5.56, 9.0.36, 10.0.0-M6 or later.

Affected Software/OS

Apache Tomcat 8.5.0 to 8.5.55, 9.0.0.M1 to 9.0.35 and 10.0.0-M1 to 10.0.0-M5.

Vulnerability Insight

A specially crafted sequence of HTTP/2 requests sent to Apache Tomcat could trigger high CPU usage for several seconds. If a sufficient number of such requests were made on concurrent HTTP/2 connections, the server could become unresponsive.

Solution:
Solution type: VendorFix
Update to version 8.5.57, 9.0.37, 10.0.0-M7 or later.

Affected Software/OS
Apache Tomcat 8.5.1 to 8.5.56, 9.0.0.M5 to 9.0.36 and 10.0.0-M1 to 10.0.0-M6.

Vulnerability Insight
The following vulnerabilitities exist:
- HTTP/2 Denial of Service (CVE-2020-13934)
- WebSocket Denial of Service (CVE-2020-13935)

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to a session fixation vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.50
Installation

```

Solution:

Solution type: VendorFix

Update to version 7.0.99, 8.5.50, 9.0.30 or later.

Affected Software/OS

Apache Tomcat 7.0.0 to 7.0.98, 8.5.0 to 8.5.49 and 9.0.0.M1 to 9.0.29.

Vulnerability Insight

When using FORM authentication there was a narrow window where an attacker could perform a session fixation attack. The window was considered too narrow for an exploit to be practical but, erring on the side of caution, this issue has been treated as a security vulnerability.

Impact
Successful exploitation will allow an attacker to bypass certain security restrictions and perform unauthorized actions.

Solution:
Solution type: VendorFix
Upgrade to Apache Tomcat version 9.0.10 or 8.5.32 or 8.0.53 or 7.0.90 or later. Please see the references for more information.

Affected Software/OS
Apache Tomcat versions 9.0.0.M1 to 9.0.9, 8.5.0 to 8.5.31, 8.0.0.RC1 to 8.0.52 and 7.0.35 to 7.0.88 on Linux.

Vulnerability Insight
The flaw exists due to a missing host name verification when using TLS with the WebSocket client.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:

Solution type: VendorFix

Update to version 8.5.83, 9.0.68, 10.0.27, 10.1.1 or later.

Vulnerability Insight
If Tomcat is configured to ignore invalid HTTP headers via setting rejectIllegalHeader to false (the default for 8.5.x only), Tomcat does not reject a request containing an invalid Content-Length header making a request smuggling attack possible if Tomcat is located behind a reverse proxy that also fails to reject the request with the invalid header.

Checks if a vulnerable version is present on the target host.

. . . continued from previous page . . .

Update to version 8.5.96, 9.0.83, 10.1.16, 11.0.0-M11 or later.

Affected Software/OS
Apache Tomcat versions 8.5.0 through 8.5.95, 9.0.0-M1 through 9.0.82, 10.1.0-M1 through 10.1.15 and 11.0.0-M1 through 11.0.0-M10.

Vulnerability Insight
Tomcat does not correctly parse HTTP trailer headers. A specially crafted trailer header that exceeds the header size limit could cause Tomcat to treat a single request as multiple requests leading to the possibility of request smuggling when behind a reverse proxy.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to a denial of service (DoS) vulnerability when running with enabled Tomcat clustering over an untrusted network.

Quality of Detection (QoD): 1%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     See solution information
Installation

Solution:

Solution type: Mitigation

- Don't run Apache Tomcat with enabled Tomcat clustering over an untrusted network
- Update Apache Tomcat to version 10.1.0-M15, 10.0.21, 9.0.63, 8.5.79 or later to receive the corrected / updated documentation

Affected Software/OS

- The documentation in Apache Tomcat 8.5.38 through 8.5.78, 9.0.13 through 9.0.62, 10.0.0-M1 through 10.0.20 and 10.1.0-M1 to 10.1.0-M14
- Apache Tomcat when running with enabled Tomcat clustering over an untrusted network

. . . continues on next page . . .

. . . continued from previous page . . .

Vulnerability Insight
The documentation for the EncryptInterceptor incorrectly stated it enabled Tomcat clustering to run over an untrusted network. This was not correct. While the EncryptInterceptor does provide confidentiality and integrity protection, it does not protect against all risks associated with running over any untrusted network, particularly DoS risks.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary
Apache Tomcat is prone to a denial of service (DoS) vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.85
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.85, 9.0.71, 10.1.5, 11.0.0-M3 or later.

Affected Software/OS
Apache Tomcat versions through 8.5.84, 9.0.0-M1 through 9.0.70, 10.x through 10.1.4 and 11.0.0-M1 only.

Vulnerability Insight
Apache Tomcat uses a packaged renamed copy of Apache Commons FileUpload to provide the file upload functionality defined in the Jakarta Servlet specification. Apache Tomcat was, therefore, also vulnerable to the Apache Commons FileUpload vulnerability CVE-2023-24998 as there was no limit to the number of request parts processed. This resulted in the possibility of an attacker triggering a DoS with a malicious upload or series of uploads.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

```

Solution:

Solution type: VendorFix

Update to version 7.0.104, 8.5.55, 9.0.35, 10.0.0-M5 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache Tomcat 7.0.0 to 7.0.103, 8.5.0 to 8.5.54, 9.0.0.M1 to 9.0.34 and 10.0.0-M1 to 10.0.0-M4.

Vulnerability Insight
If:
- an attacker is able to control the contents and name of a file on the server and
- the server is configured to use the PersistenceManager with a FileStore and
- the PersistenceManager is configured with sessionAttributeValueClassNameFilter='null' (the default unless a SecurityManager is used) or a sufficiently lax filter to allow the attacker provided object to be deserialized and
- the attacker knows the relative file path from the storage location used by FileStore to the file the attacker has control over
then, using a specifically crafted request, the attacker will be able to trigger remote code execution via deserialization of the file under their control. Note that all of conditions must be true for the attack to succeed.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.49
Installation
path / port:       8081/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.0.99, 8.5.49, 9.0.29 or later. As a mitigation disable Tomcat's JmxRemoteLifecycleListener and use the built-in remote JMX facilities provided by the JVM.

Affected Software/OS

Apache Tomcat 7.0.0 to 7.0.97, 8.5.0 to 8.5.47 and 9.0.0.M1 to 9.0.28.

Vulnerability Insight

When Tomcat is configured with the JMX Remote Lifecycle Listener, a local attacker without access to the Tomcat process or configuration files is able to manipulate the RMI registry to perform a man-in-the-middle attack to capture user names and passwords used to access the JMX interface. The attacker can then use these credentials to access the JMX interface and gain complete control over the Tomcat instance.

```
Installed version: 8.5.23
Fixed version:     8.5.63
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.108, 8.5.63, 9.0.43, 10.0.2 or later.

Affected Software/OS
Apache Tomcat 7.0.x - 7.0.107, 8.5.x - 8.5.61, 9.0.0.M1 - 9.0.41 and 10.0.x prior to 10.0.1.

Vulnerability Insight
The fix for CVE-2020-9484 was incomplete. When using a highly unlikely configuration edge case, the Tomcat instance is still vulnerable to CVE-2020-9484. Note that both the previously published prerequisites for CVE-2020-9484 also apply to this issue.

Summary

Apache Tomcat is prone to an authentication weakness vulnerability in the JNDI Realm.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.66
Installation
path / port:       8040/tcp
```

Solution:

Solution type: VendorFix

Update to version 7.0.109, 8.5.66, 9.0.46, 10.0.6 or later.

Affected Software/OS

Apache Tomcat 7.0.x through 7.0.108, 8.5.x through 8.5.65, 9.0.0.M1 through 9.0.45 and 10.0.0-M1 through 10.0.5.

Vulnerability Insight

Queries made by the JNDI Realm do not always correctly escape parameters. Parameter values could be sourced from user provided data (eg user names) as well as configuration data provided by an administrator. In limited circumstances it is possible for users to authenticate using variations of their user name and/or to bypass some of the protection provided by the LockOut Realm.

Apache Tomcat is prone to multiple access bypass vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.28
Installation
path / port:       8040/tcp
```

Impact
Successfully exploiting these issues will allow remote attackers to bypass security constraints to access ostensibly restricted resources on the target system.

Solution:
Solution type: VendorFix
Upgrade to Apache Tomcat version 9.0.5, 8.5.28, 8.0.50, 7.0.85 or later.

Affected Software/OS
Apache Tomcat versions 9.0.0.M1 to 9.0.4
Apache Tomcat versions 8.5.0 to 8.5.27
Apache Tomcat versions 8.0.0.RC1 to 8.0.49
Apache Tomcat versions 7.0.0 to 7.0.84 on Linux.

Vulnerability Insight
Multiple flaws are due to:
- The system does not properly enforce security constraints that defined by annotations of Servlets in certain cases, depending on the order that Servlets are loaded.
- The URL pattern of " (the empty string) which exactly maps to the context root was not correctly handled when used as part of a security constraint definition.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary
Apache Tomcat is prone to an authentication bypass vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.96
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.96, 10.1.31, 11.0.0 or later.

Affected Software/OS
Apache Tomcat versions prior to 9.0.96, 10.0.x through 10.1.30 and 11.0.0-M1 through 11.0.0-M26.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by this flaw. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
If Tomcat was configured to use a custom Jakarta Authentication (formerly JASPIC) ServerAuthContext component which may throw an exception during the authentication process without explicitly setting an HTTP status to indicate failure, the authentication may not have failed, allowing the user to bypass the authentication process. There are no known Jakarta Authentication components that behave in this way.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary
Apache Tomcat is prone to a cross-site scripting vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     8.5.40
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 7.0.94, 8.5.40, 9.0.18 or later.

Affected Software/OS
Apache Tomcat versions 7.0.0 to 7.0.93, 8.5.0 to 8.5.39 and 9.0.0.M1 to 9.0.17.

Vulnerability Insight
The SSI printenv command in Apache Tomcat echoes user provided data without escaping and is, therefore, vulnerable to XSS. SSI is disabled by default. The printenv command is intended for debugging and is unlikely to be present in a production website.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to version 7.0.107, 8.5.60, 9.0.40, 10.0.0-M10 or later.

Affected Software/OS
Apache Tomcat 7.0.0 to 7.0.106, 8.5.0 to 8.5.59, 9.0.0.M1 to 9.0.39 and 10.0.0-M1 to 10.0.0-M9.

Vulnerability Insight
When serving resources from a network location using the NTFS file system it was possible to bypass security constraints and/or view the source code for JSPs in some configurations. The root cause was the unexpected behaviour of the JRE API File.getCanonicalPath() which in turn was caused by the inconsistent behaviour of the Windows API (FindFirstFileW) in some circumstances.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to version 8.5.68, 9.0.48, 10.0.7 or later.

Affected Software/OS
Apache Tomcat 8.5.x through 8.5.66, 9.0.0.M1 through 9.0.46 and 10.0.0-M1 through 10.0.6.

Vulnerability Insight
Apache Tomcat does not correctly parse the HTTP transfer-encoding request header in some circumstances leading to the possibility to request smuggling when used with a reverse proxy. Specifically: Tomcat incorrectly ignores the transfer-encoding header if the client declared it would only accept an HTTP/1.0 response. Tomcat honours the identify encoding and Tomcat does not ensure that, if present, the chunked encoding is the final encoding.

Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to version 8.5.99, 9.0.86, 10.1.19, 11.0.0-M17 or later.

Affected Software/OS
Apache Tomcat versions prior to 8.5.99, 9.0.0-M1 through 9.0.85, 10.x through 10.1.18 and 11.0.0-M1 through 11.0.0-M16.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 8.5.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
The following flaws exist:
- CVE-2024-23672: WebSocket DoS with incomplete closing handshake
- CVE-2024-24549: HTTP/2 header handling DoS

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to version 9.0.98, 10.1.34, 11.0.2 or later.
Vendor note: Users running Tomcat on a case insensitive file system with the default servlet write enabled (readonly initialisation parameter set to the non-default value of false) may need additional configuration to fully mitigate CVE-2024-50379 depending on which version of Java they are using with Tomcat:
- running on Java 8 or Java 11: the system property sun.io.useCanonCaches must be explicitly set to false (it defaults to true)
- running on Java 17: the system property sun.io.useCanonCaches, if set, must be set to false (it defaults to false)
- running on Java 21 onwards: no further configuration is required (the system property and the problematic cache have been removed)

Affected Software/OS
Apache Tomcat versions prior to 9.0.98, 10.x prior to 10.1.34 and 11.x prior to 11.0.2.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
The following flaws exist:
- CVE-2024-50379: Remote code execution (RCE) via write-enabled default servlet
- CVE-2024-54677: Denial of service (DoS) in examples web application
- CVE-2024-56337: RCE via write-enabled default servlet - CVE-2024-50379 mitigation was incomplete

Installed version: 8.5.23

```

Solution:
Solution type: VendorFix
Update to version 9.0.105, 10.1.41, 11.0.7 or later.

Affected Software/OS
Apache Tomcat version 9.0.104 and prior, 10.x through 10.1.40 and 11.0.0-M1 through 11.0.6.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
When running on a case insensitive file system with security constraints configured for the <code>pathInfo</code> component of a URL that mapped to the CGI servlet, it is possible to bypass those security constraints with a specially crafted URL.

Summary
Apache Tomcat is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 30%

Vulnerability Detection Result
```
Installed version: 8.5.23
Fixed version:     8.5.86
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.86, 9.0.72, 10.1.6, 11.0.0-M3 or later.

Affected Software/OS
Apache Tomcat versions through 8.5.85, 9.0.0-M1 through 9.0.71, 10.x through 10.1.5 and 11.0.0-M1 through 11.0.0-M2.

Vulnerability Insight
When using the RemoteIpFilter with requests received from a reverse proxy via HTTP that include the X-Forwarded-Proto header set to https, session cookies created by Tomcat did not include the secure attribute. This could result in the user agent transmitting the session cookie over an insecure channel.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Solution:
Solution type: VendorFix
Update to version 8.5.58, 9.0.38, 10.0.0-M8 or later.

Affected Software/OS
Apache Tomcat 8.5.1 to 8.5.57, 9.0.0.M5 to 9.0.37 and 10.0.0-M1 to 10.0.0-M7.

Vulnerability Insight
If an HTTP/2 client exceeded the agreed maximum number of concurrent streams for a connection (in violation of the HTTP/2 protocol), it is possible that a subsequent request made on that connection could contain HTTP headers - including HTTP/2 pseudo headers - from a previous request rather than the intended headers. This could lead to users seeing responses for unexpected resources.

Update to version 7.0.109, 8.5.66, 9.0.46, 10.0.6 or later.

Affected Software/OS
Apache Tomcat 7.0.x through 7.0.108, 8.5.x through 8.5.65, 9.0.0.M1 through 9.0.45 and 10.0.0-M1 through 10.0.5.

Vulnerability Insight
Queries made by the JNDI Realm do not always correctly escape parameters. Parameter values could be sourced from user provided data (eg user names) as well as configuration data provided by an administrator. In limited circumstances it is possible for users to authenticate using variations of their user name and/or to bypass some of the protection provided by the LockOut Realm.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Summary

Apache Tomcat is prone to multiple access bypass vulnerabilities.

Impact

Successfully exploiting these issues will allow remote attackers to bypass security constraints to access ostensibly restricted resources on the target system.

Solution:

Solution type: VendorFix

Upgrade to Apache Tomcat version 9.0.5, 8.5.28, 8.0.50, 7.0.85 or later.

Affected Software/OS

Apache Tomcat versions 9.0.0.M1 to 9.0.4
Apache Tomcat versions 8.5.0 to 8.5.27
Apache Tomcat versions 8.0.0.RC1 to 8.0.49
Apache Tomcat versions 7.0.0 to 7.0.84 on Linux.

Vulnerability Insight

Multiple flaws are due to:
- The system does not properly enforce security constraints that defined by annotations of Servlets in certain cases, depending on the order that Servlets are loaded.

. . . continues on next page . . .

. . . continued from previous page . . .

- The URL pattern of " (the empty string) which exactly maps to the context root was not correctly handled when used as part of a security constraint definition.

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.96
Installation
path / port:       8081/tcp
```

Solution:

Solution type: VendorFix

Update to version 9.0.96, 10.1.31, 11.0.0 or later.

Affected Software/OS

Apache Tomcat versions prior to 9.0.96, 10.0.x through 10.1.30 and 11.0.0-M1 through 11.0.0-M26.

Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by this flaw. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight

If Tomcat was configured to use a custom Jakarta Authentication (formerly JASPIC) ServerAuthContext component which may throw an exception during the authentication process without explicitly setting an HTTP status to indicate failure, the authentication may not have failed, allowing the user to bypass the authentication process. There are no known Jakarta Authentication components that behave in this way.

Affected Software/OS
Apache Tomcat versions 7.0.0 to 7.0.93, 8.5.0 to 8.5.39 and 9.0.0.M1 to 9.0.17.

Vulnerability Insight
The SSI printenv command in Apache Tomcat echoes user provided data without escaping and is, therefore, vulnerable to XSS. SSI is disabled by default. The printenv command is intended for debugging and is unlikely to be present in a production website.

Impact

Successful exploitation can allow an attacker to reuse user sessions in a new connection.

Solution:

Solution type: VendorFix

Upgrade to Apache Tomcat version 9.0.10, 8.5.32 or later. Please see the references for more information.

Affected Software/OS

Apache Tomcat 9.0.0.M9 to 9.0.9 Apache Tomcat 8.5.5 to 8.5.31 on Linux.

Vulnerability Insight

The flaw exists due to an error where a mishandling of close in 'NIO/NIO2' connectors, user sessions can get mixed up.

Solution:

Solution type: VendorFix

Update to version 7.0.107, 8.5.60, 9.0.40, 10.0.0-M10 or later.

Affected Software/OS

Apache Tomcat 7.0.0 to 7.0.106, 8.5.0 to 8.5.59, 9.0.0.M1 to 9.0.39 and 10.0.0-M1 to 10.0.0-M9.

Vulnerability Insight

When serving resources from a network location using the NTFS file system it was possible to bypass security constraints and/or view the source code for JSPs in some configurations. The root cause was the unexpected behaviour of the JRE API File.getCanonicalPath() which in turn was caused by the inconsistent behaviour of the Windows API (FindFirstFileW) in some circumstances.

Vulnerability Detection Method

Checks if a vulnerable version is present on the target host.

Fixed version: 8.5.68
Installation
path / port: 8081/tcp

. . . continued from previous page . . .

Solution:
Solution type: VendorFix
Update to version 8.5.68, 9.0.48, 10.0.7 or later.

Affected Software/OS
Apache Tomcat 8.5.x through 8.5.66, 9.0.0.M1 through 9.0.46 and 10.0.0-M1 through 10.0.6.

Vulnerability Insight
Apache Tomcat does not correctly parse the HTTP transfer-encoding request header in some circumstances leading to the possibility to request smuggling when used with a reverse proxy. Specifically: Tomcat incorrectly ignores the transfer-encoding header if the client declared it would only accept an HTTP/1.0 response. Tomcat honours the identify encoding and Tomcat does not ensure that, if present, the chunked encoding is the final encoding.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Impact
Successfully exploiting this issue will result some scripts failing to execute as expected and other scripts to execute unexpectedly.

Solution:
Solution type: VendorFix
Update to version 7.0.84, 8.0.48, 8.5.24, 9.0.2 or later.

Affected Software/OS
Apache Tomcat versions 7.0.79 through 7.0.82, 8.0.45 through 8.0.47, 8.5.16 through 8.5.23 and 9.0.0.M22 through 9.0.1.

Vulnerability Insight
The flaw exists as the description of the search algorithm used by the CGI Servlet to identify which script to execute was not correct.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Apache Tomcat is prone to multiple vulnerabilities.

Quality of Detection (QoD): 30%

Vulnerability Detection Result

Installed version:	8.5.23
Fixed version:	9.0.98
Installation path / port:	8081/tcp

Solution:
Solution type: VendorFix
Update to version 9.0.98, 10.1.34, 11.0.2 or later.
Vendor note: Users running Tomcat on a case insensitive file system with the default servlet write enabled (readonly initialisation parameter set to the non-default value of false) may need additional configuration to fully mitigate CVE-2024-50379 depending on which version of Java they are using with Tomcat:
- running on Java 8 or Java 11: the system property sun.io.useCanonCaches must be explicitly set to false (it defaults to true)
- running on Java 17: the system property sun.io.useCanonCaches, if set, must be set to false (it defaults to false)
- running on Java 21 onwards: no further configuration is required (the system property and the problematic cache have been removed)

Affected Software/OS
Apache Tomcat versions prior to 9.0.98, 10.x prior to 10.1.34 and 11.x prior to 11.0.2.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
The following flaws exist:
- CVE-2024-50379: Remote code execution (RCE) via write-enabled default servlet
- CVE-2024-54677: Denial of service (DoS) in examples web application
- CVE-2024-56337: RCE via write-enabled default servlet - CVE-2024-50379 mitigation was incomplete

Vulnerability Detection Result

```
Installed version: 8.5.23
Fixed version:     9.0.105
Installation
path / port:       8081/tcp
```

Solution:
Solution type: VendorFix
Update to version 9.0.105, 10.1.41, 11.0.7 or later.

Affected Software/OS
Apache Tomcat version 9.0.104 and prior, 10.x through 10.1.40 and 11.0.0-M1 through 11.0.6.
Note: While not explicitly mentioned by the vendor (due to the EOL status of these branches) it is assumed that the whole 10.x branch and all versions prior to 9.x are affected by these flaws. If you disagree with this assessment and want to accept the risk please create an override for this result.

Vulnerability Insight
When running on a case insensitive file system with security constraints configured for the <code>pathInfo</code> component of a URL that mapped to the CGI servlet, it is possible to bypass those security constraints with a specially crafted URL.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

Affected Software/OS

Apache Tomcat versions through 8.5.85, 9.0.0-M1 through 9.0.71, 10.x through 10.1.5 and 11.0.0-M1 through 11.0.0-M2.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

When using the RemoteIpFilter with requests received from a reverse proxy via HTTP that include the X-Forwarded-Proto header set to https, session cookies created by Tomcat did not include the secure attribute. This could result in the user agent transmitting the session cookie over an insecure channel.

Solution:

Solution type: VendorFix

Update to version 8.5.58, 9.0.38, 10.0.0-M8 or later.

. . . continues on next page . . .

. . . continued from previous page . . .

Affected Software/OS
Apache Tomcat 8.5.1 to 8.5.57, 9.0.0.M5 to 9.0.37 and 10.0.0-M1 to 10.0.0-M7.

Vulnerability Insight
If an HTTP/2 client exceeded the agreed maximum number of concurrent streams for a connection (in violation of the HTTP/2 protocol), it is possible that a subsequent request made on that connection could contain HTTP headers - including HTTP/2 pseudo headers - from a previous request rather than the intended headers. This could lead to users seeing responses for unexpected resources.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.

2.1.8 Low general/icmp

Low (CVSS: 2.1)
NVT: ICMP Timestamp Reply Information Disclosure

Summary

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following response / ICMP packet has been received:
- ICMP Type: 14
- ICMP Code: 0
```

Impact

This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:

Solution type: Mitigation

Various mitigations are possible:

- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight

The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method

Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.

Details: `ICMP Timestamp Reply Information Disclosure`

Vulnerability Detection Result
```
Installed version: 8.5.23
Fixed version:     8.5.78
Installation
path / port:       8040/tcp
```

Solution:
Solution type: VendorFix
Update to version 8.5.78, 9.0.62, 10.0.20, 10.1.0-M14 or later.

Affected Software/OS
Apache Tomcat version 8.5.0 through 8.5.77, 9.0.0-M1 through 9.0.60, 10.0.0-M1 through 10.0.18 and 10.1.0-M1 through 10.1.0-M12.

Vulnerability Insight
The simplified implementation of blocking reads and writes introduced in Tomcat 10 and backported to Tomcat 9.0.47 onwards exposed a long standing (but extremely hard to trigger) concurrency bug that could cause client connections to share an Http11Processor instance resulting in responses, or part responses, to be received by the wrong client.

2.1.10 Low general/tcp

Low (CVSS: 2.6)
NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 2914887598
Packet 2: 2914888678
```

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled' Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.
The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS
TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight

. . . continues on next page . . .

. . . continued from previous page . . .

The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method
Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.

Summary
This script consolidates the OS information detected by several VTs and tries to find the best matching OS.
Furthermore it reports all previously collected information leading to this best matching OS. It also reports possible additional information which might help to improve the OS detection.
If any of this information is wrong or could be improved please consider to report these to the referenced community forum.

NVT: Web Application Scanning Consolidation / Info Reporting

Summary
The script consolidates and reports various information for web application (formerly called 'CGI') scanning.
This information is based on the following scripts / settings:
- HTTP-Version Detection (OID: 1.3.6.1.4.1.25623.1.0.100034)
- No 404 check (OID: 1.3.6.1.4.1.25623.1.0.10386)
- Web mirroring / webmirror.nasl (OID: 1.3.6.1.4.1.25623.1.0.10662)
- Directory Scanner / DDI_Directory_Scanner.nasl (OID: 1.3.6.1.4.1.25623.1.0.11032)
- The configured 'cgi_path' within the 'Scanner Preferences' of the scan config in use
- The configured 'Enable CGI scanning', 'Enable generic web application scanning' and 'Add historic /scripts and /cgi-bin to directories for CGI scanning' within the 'Global variable settings' of the scan config in use

↪he scan config in use.
Requests to this service are done via HTTP/1.1.
This service seems to be able to host PHP scripts.
This service seems to be able to host ASP scripts.
The User-Agent "Mozilla/5.0 [en] (X11, U; OpenVAS-VT <version replaced>)" was us
↪ed to access the remote host.
Historic /scripts and /cgi-bin are not added to the directories used for web app
↪lication scanning. You can enable this again with the "Add historic /scripts a
↪nd /cgi-bin to directories for CGI scanning" option within the "Global variabl
↪e settings" of the scan config in use.
The following directories were used for web application scanning:
http://artifactory5.trabalho_vulnnet:8081/
http://artifactory5.trabalho_vulnnet:8081/artifactory
While this is not, in and of itself, a bug, you should manually inspect these di
